

Ultra-low power 32-MHz ARM® Cortex®-M0+ microcontroller, up to 128-KB code flash memory, 16-KB SRAM, Capacitive Touch Sensing Unit, 14-bit A/D Converter, 12-bit D/A Converter, security and safety features.

## Features

### ■ ARM Cortex-M0+ Core

- ARMv6-M architecture
- Maximum operating frequency: 32 MHz
- Debug and Trace: DWT, BPU, CoreSight™ MTB-M0+
- CoreSight Debug Port: SW-DP

### ■ Memory

- Up to 128-KB code flash memory
- 4-KB data flash memory (up to 100,000 erase/write cycles)
- Up to 16-KB SRAM
- 128-bit unique ID

### ■ Connectivity

- USB 2.0 Full-Speed Module (USBFS)
  - On-chip transceiver with voltage regulator
  - Compliant with USB Battery Charging Specification 1.2
- Serial Communications Interface (SCI) × 3
  - UART
  - Simple IIC
  - Simple SPI
- Serial Peripheral Interface (SPI) × 2
- I<sup>2</sup>C bus interface (IIC) × 2
- CAN module (CAN)

### ■ Analog

- 14-Bit A/D Converter (ADC14)
- 12-Bit D/A Converter (DAC12)
- Low-Power Analog Comparator (ACMPLP) × 2
- Temperature Sensor (TSN)

### ■ Timers

- General PWM Timer 32-Bit (GPT32)
- General PWM Timer 16-Bit (GPT16) × 6
- Asynchronous General-Purpose Timer (AGT) × 2
- Watchdog Timer (WDT)

### ■ Safety

- SRAM Parity Error Check
- Flash Area Protection
- ADC self-diagnosis function
- Clock Frequency Accuracy Measurement Circuit (CAC)
- Cyclic Redundancy Check (CRC) Calculator
- Data Operation Circuit (DOC)
- Port Output Enable for GPT (POEG)
- Independent Watchdog Timer (IWDT)
- GPIO Readback Level Detection
- Register Write Protection
- Main Oscillator Stop Detection

### ■ System and Power Management

- Low-power modes
- RealTime Clock (RTC)
- Event Link Controller (ELC)
- Data Transfer Controller (DTC)
- Key Interrupt Function (KINT)
- Power-on reset
- Low Voltage Detection with voltage settings

### ■ Security and Encryption

- AES128/256
- True Random Number Generator (TRNG)

### ■ Human Machine Interface (HMI)

- Capacitive Touch Sensing Unit (CTSU)

### ■ Multiple Clock Sources

- Main clock oscillator (MOSC)
  - (1 to 20 MHz when VCC = 2.4 to 5.5 V)
  - (1 to 8 MHz when VCC = 1.8 to 5.5 V)
  - (1 to 4 MHz when VCC = 1.6 to 5.5 V)
- Sub-clock oscillator (SOSC) (32.768 kHz)
- High-speed on-chip oscillator (HOCO)
  - (24, 32, 48, 64 MHz when VCC = 2.4 to 5.5 V)
  - (24, 32, 48 MHz when VCC = 1.8 to 5.5 V)
  - (24, 32 MHz when VCC = 1.6 to 5.5 V)
- Middle-speed on-chip oscillator (MOCO) (8 MHz)
- Low-speed on-chip oscillator (LOCO) (32.768 kHz)
- Independent watchdog timer OCO (15 kHz)
- Clock trim function for HOCO/MOCO/LOCO
- Clock out support

### ■ General Purpose I/O Ports

- Up to 51 input/output pins
  - Up to 3 CMOS input
  - Up to 48 CMOS input/output
    - Up to 6 5-V tolerant input/output (when VCC = 3.6 V)
    - Up to 16 pins high current (20 mA)

### ■ Operating Voltage

- VCC: 1.6 to 5.5 V

### ■ Operating Temperature and Packages

- Ta = -40°C to +85°C
  - 36-pin LGA (4 mm × 4 mm, 0.5 mm pitch)
- Ta = -40°C to +105°C
  - 64-pin LQFP (10 mm × 10 mm, 0.5 mm pitch)
  - 48-pin LQFP (7 mm × 7 mm, 0.5 mm pitch)
  - 64-pin QFN (8 mm × 8 mm, 0.4 mm pitch)
  - 48-pin QFN (7 mm × 7 mm, 0.5 mm pitch)
  - 40-pin QFN (6 mm × 6 mm, 0.5 mm pitch)

## 1. Overview

The S124 MCU comprises multiple series of software- and pin-compatible ARM-based 32-bit MCUs that share a common set of Renesas peripherals to facilitate design scalability and efficient platform-based product development.

Based on the energy-efficient ARM® Cortex®-M0+ 32-bit core, this MCU is particularly well suited for cost-sensitive and low-power applications. The MCU in this series feature:

- Up to 128 KB code flash memory
- 16-KB SRAM
- Capacitive Touch Sensing Unit (CTSU)
- 14-bit ADC
- 12-bit DAC
- Security features.

Feature	Functional description
Code flash memory	Maximum 128 KB code flash memory. See section 37, Flash Memory in User's Manual.
Data flash memory	4 KB data flash memory. See section 37, Flash Memory in User's Manual.
Option-Setting Memory	The option-setting memory determines the state of the MCU after a reset. See section 6, Option-Setting Memory and Information Memory in User's Manual.
SRAM	The MCU has an on-chip high-speed SRAM with even parity bit. See section 36, SRAM in User's Manual.

Operating mode	<p>Two operating modes:</p> <ul style="list-style-type: none"> <li>• Single-chip mode</li> <li>• SCI boot mode.</li> </ul> <p>See section 3, Operating Modes in User's Manual.</p>
Reset	<p>The MCU has 9 types of resets:</p> <ul style="list-style-type: none"> <li>• RES pin reset</li> <li>• Power-on reset</li> <li>• Independent watchdog timer reset</li> <li>• Watchdog timer reset</li> <li>• Voltage monitor 0 reset</li> <li>• Voltage monitor 1 reset</li> <li>• Voltage monitor 2 reset</li> <li>• SRAM parity error reset</li> <li>• Software reset.</li> </ul> <p>See section 5, Resets in User's Manual.</p>

**Table 1.3 System (2/2)**

Feature	Functional description
Low Voltage Detection (LVD)	The Low Voltage Detection (LVD) monitors the voltage level input to the VCC pin and the detection level can be selected using a software program. See section 7, Low Voltage Detection (LVD) in User's Manual.
Clock	<ul style="list-style-type: none"> <li>• Main clock oscillator (MOSC)</li> <li>• Sub-clock oscillator (SOSC)</li> <li>• High-speed on-chip oscillator (HOCO)</li> <li>• Middle-speed on-chip oscillator (MOCO)</li> <li>• Low-speed on-chip oscillator (LOCO)</li> <li>• Independent Watchdog Timer on-chip oscillator</li> <li>• Clock out support.</li> </ul> <p>See section 8, Clock Generation Circuit in User's Manual.</p>
Clock Frequency Accuracy Measurement Circuit (CAC)	<p>The clock frequency accuracy measurement circuit (CAC) is used to check the system clock frequency with a reference clock signal by counting the number of pulses of the system clock to be measured. The reference clock can be provided externally through a CACREF pin or internally from various on-chip oscillators.</p> <p>Event signals can be generated when the clock does not match or measurement ends. This feature is particularly useful in implementing a fail-safe mechanism for home and industrial automation applications.</p> <p>See section 9, Clock Frequency Accuracy Measurement Circuit (CAC) in User's Manual.</p>
Low Power Mode	The MCU has several functions for reducing power consumption, such as setting clock dividers, stopping modules, selecting power control mode in normal operation, and transitioning to low power modes. See section 10, Low Power Modes in User's Manual.
Register Write Protection	The Register Write Protection function protects important registers from being overwritten due to software errors. See section 11, Register Write Protection in User's Manual.
Watchdog Timer (WDT)	The Watchdog Timer (WDT) is a 14-bit down-counter. It can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, a non-maskable interrupt or interrupt can be generated by an underflow. The refresh-permitted period can be set to refresh the counter and used as the condition to detect when the system runs out of control. See section 22, Watchdog Timer (WDT) in User's Manual.
Independent Watchdog Timer (IWDT)	The Independent Watchdog Timer (IWDT) consists of a 14-bit down-counter that must be serviced periodically to prevent counter underflow. The IWDT provides functionality to reset the MCU or to generate a non-maskable interrupt/interrupt for a timer underflow. Because the timer operates with an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a fail safe mechanism when the system runs out of control. The watchdog timer can be triggered automatically on reset, underflow, or refresh error, or by a refresh of the count value in the registers. See section 23, Independent Watchdog Timer (IWDT) in User's Manual.

**Table 1.4 Interrupt Control**

Feature	Functional description
Interrupt Controller Unit (ICU)	The Interrupt Controller Unit (ICU) controls which event signals are linked to the NVIC/DTC module. The ICU also controls NMI interrupts. See section 12, Interrupt Controller Unit (ICU) in User's Manual.

**Table 1.5 Event Link**

Feature	Functional description
Event Link Controller (ELC)	The Event Link Controller (ELC) uses the interrupt requests generated by various peripheral modules as event signals to connect them to different modules, enabling direct interaction between the modules without CPU intervention. See section 15, Event Link Controller (ELC) in User's Manual.

**Table 1.6 Direct memory access**

Feature	Functional description
Data Transfer Controller (DTC)	The MCU incorporates a Data Transfer Controller (DTC) that performs data transfers when activated by an interrupt request. See section 14, Data Transfer Controller (DTC) in User's Manual.

**Table 1.7 Timers**

Feature	Functional description
General PWM Timer (GPT)	The General PWM Timer (GPT) is a 32-bit timer with 1 channel and a 16-bit timer with 6 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. In addition, PWM waveforms for controlling brushless DC motors can be generated. The GPT can also be used as a general-purpose timer. See section 19, General PWM Timer (GPT) in User's Manual.
Port Output Enable for GPT (POEG)	Use the Port Output Enable for GPT (POEG) function to place the General PWM Timer (GPT) output pins in the output disable state. See section 18, Port Output Enable for GPT (POEG) in User's Manual.
Asynchronous General Purpose Timer (AGT)	The Asynchronous General Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This 16-bit timer consists of a reload register and a down-counter. The reload register and the down-counter are allocated to the same address, and they can be accessed with the AGT register. See section 20, Asynchronous General Purpose Timer (AGT) in User's Manual.
Realtime Clock (RTC)	The Realtime Clock (RTC) has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar. See section 21, Realtime Clock (RTC) in User's Manual.

**Table 1.8 Communication interfaces (1/2)**

Feature	Functional description
Serial Communications Interface (SCI)	The Serial Communication Interface (SCI) is configurable to five asynchronous and synchronous serial interfaces: <ul style="list-style-type: none"> <li>• Asynchronous interfaces (UART and asynchronous communications interface adapter (ACIA))</li> <li>• 8-bit clock synchronous interface</li> <li>• Simple IIC (master-only)</li> <li>• Simple SPI</li> <li>• Smart card interface</li> </ul> The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. SCI0 has FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator. See section 25, Serial Communications Interface (SCI) in User's Manual.
I <sup>2</sup> C Bus interface (IIC)	The MCU has a two-channel I <sup>2</sup> C bus interface (IIC). The IIC module conforms with and provides a subset of the NXP I <sup>2</sup> C bus (Inter-Integrated Circuit bus) interface functions. See section 26, I <sup>2</sup> C Bus Interface (IIC) in User's Manual.
Serial Peripheral Interface (SPI)	The MCU includes two independent channels of the Serial Peripheral Interface (SPI). The SPI channels are capable of high-speed, full-duplex synchronous serial communications with multiple processors and peripheral devices. See section 28, Serial Peripheral Interface (SPI) in User's Manual.
Controller Area Network (CAN) Module	The Controller Area Network (CAN) module provides functionality to receive and transmit data using a message-based protocol between multiple slaves and masters in electromagnetically noisy applications. The CAN module complies with the ISO 11898-1 (CAN 2.0A/CAN 2.0B) standard and supports up to 32 mailboxes, which can be configured for transmission or reception in normal mailbox and FIFO modes. Both standard (11-bit) and extended (29-bit) messaging formats are supported. See section 27, Controller Area Network (CAN) Module in User's Manual.

**Table 1.8 Communication interfaces (2/2)**

Feature	Functional description
USB 2.0 Full-Speed Module (USBFS)	The MCU incorporates a USB 2.0 Full-Speed module (USBFS). The USBFS is a USB controller that is equipped to operate as a device controller. The module supports full-speed and low-speed transfer as defined in the Universal Serial Bus Specification 2.0. The module has an internal USB transceiver and supports all of the transfer types defined in the Universal Serial Bus Specification 2.0. The USB has buffer memory for data transfer, providing a maximum of 5 pipes. PIPE0 and PIPE4 to PIPE7 can be assigned any endpoint number based on the peripheral devices used for communication or based on the user system. The MCU supports revision 1.2 of the battery charging specification. Because the MCU can be powered at 5 V, the USB LDO regulator provides the internal USB transceiver power supply 3.3 V. See section 24, USB 2.0 Full-Speed Module (USBFS) in User's Manual.

**Table 1.9 Analog**

Feature	Functional description
14-bit A/D Converter (ADC14)	The MCU incorporates up to one unit of a 14-bit successive approximation A/D converter. Up to 18 analog input channels are selectable. Temperature sensor output and internal reference voltage are selectable for conversion. The A/D conversion accuracy is selectable from 12-bit and 14-bit conversion making it possible to optimize the tradeoff between speed and resolution in generating a digital value. See section 30, 14-Bit A/D Converter (ADC14) in User's Manual.
12-bit D/A Converter (DAC12)	The MCU includes a 12-bit D/A converter with an output amplifier. See section 31, 12-Bit D/A Converter (DAC12) in User's Manual.
Temperature Sensor (TSN)	The on-chip Temperature Sensor can be used to determine and monitor the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is linear. The output voltage is provided to the ADC for conversion and can be further used by the end application. See section 32, Temperature Sensor (TSN) in User's Manual.
Low-Power Analog Comparator (ACMPLP)	Analog comparators can be used to compare a reference input voltage and analog input voltage. The comparison result can be read by software and also be output externally. The reference input voltage can be selected from either an input to the CMPREF <i>i</i> ( <i>i</i> = 0, 1) pin or from the internal reference voltage (Vref) generated internally in this MCU. The ACMPLP response speed can be set before starting an operation. Setting high-speed mode decreases the response delay time, but increases current consumption. Setting low-speed mode increases the response delay time, but decreases current consumption. See section 33, Low-Power Analog Comparator (ACMPLP) in User's Manual.

**Table 1.10 Human machine interfaces**

Feature	Functional description
Key Interrupt Function (KINT)	A key interrupt can be generated by setting the Key Return Mode register (KRM) and inputting a rising/falling edge to the key interrupt input pins. See section 17, Key Interrupt Function (KINT) in User's Manual.
Capacitive Touch Sensing Unit (CTSU)	The Capacitive Touch Sensing Unit (CTSU) measures the electrostatic capacitance of the touch sensor. Changes in the electrostatic capacitance are determined by software, which enables the CTSU to detect whether a finger is in contact with the touch sensor. The electrode surface of the touch sensor is usually enclosed with an electrical conductor so that a finger does not come into direct contact with the electrode. See section 34, Capacitive Touch Sensing Unit (CTSU) in User's Manual.

**Table 1.11 Data processing**

Feature	Functional description
Cyclic Redundancy Check (CRC) Calculator	The Cyclic Redundancy Check (CRC) generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB first or MSB first communication. Additionally, various CRC generation polynomials are available. The snoop function allows monitoring reads from and writes to specific addresses. This function is useful in applications that require CRC code to be generated automatically in certain events, such as monitoring writes to the serial transmit buffer and reads from the serial receive buffer. See section 29, Cyclic Redundancy Check (CRC) Calculator in User's Manual.

**Table 1.11 Data processing**

Feature	Functional description
Data Operation Circuit (DOC)	The Data Operation Circuit (DOC) is used to compare, add, and subtract 16-bit data. See section 35, Data Operation Circuit (DOC) in User's Manual.

## 1.5 Pin Functions

**Table 1.14 Pin functions (1/3)**

Function	Signal	I/O	Description
Power supply	VCC	Input	Power supply pin. Connect it to the system power supply. Connect this pin to VSS by a 0.1- $\mu$ F capacitor. The capacitor should be placed close to the pin.
	VCL	Input	Connect this pin to the VSS pin by the smoothing capacitor used to stabilize the internal power supply. Place the capacitor close to the pin.
	VSS	Input	Ground pin. Connect it to the system power supply (0 V).
Clock	XTAL	Output	Pins for a crystal resonator. An external clock signal can be input through the EXTAL pin.
	EXTAL	Input	
	XCIN	Input	Input/output pins for the sub-clock oscillator. Connect a crystal resonator between XCOUT and XCIN.
	XCOUT	Output	
	CLKOUT	Output	Clock output pin.
Operating mode control	MD	Input	Pins for setting the operating mode. The signal levels on these pins must not be changed during operation mode transition at the time of release from the reset state.
System control	RES	Input	Reset signal input pin. The MCU enters the reset state when this signal goes low.
CAC	CACREF	Input	Measurement reference clock input pin.
On-chip debug	SWDIO	I/O	Serial Wire debug Data Input/Output pin.
	SWCLK	Input	Serial Wire Clock pin.
Interrupt	NMI	Input	Non-maskable interrupt request pin.
	IRQ0 to IRQ7	Input	Maskable interrupt request pins.
GPT	GTETRGA, GTETRGB	Input	External trigger input pin.
	GTIOC0A to GTIOC6A, GTIOC0B to GTIOC6B	I/O	Input capture, Output Compare, or PWM output pin.
	GTIU	Input	Hall sensor input pin U.
	GTIV	Input	Hall sensor input pin V.
	GTIW	Input	Hall sensor input pin W.
	GTOUUP	Output	Three-phase PWM output for BLDC motor control (positive U phase).
	GTOULO	Output	Three-phase PWM output for BLDC motor control (negative U phase).
	GTOVUP	Output	Three-phase PWM output for BLDC motor control (positive V phase).
	GTOVLO	Output	Three-phase PWM output for BLDC motor control (negative V phase).
	GTOWUP	Output	Three-phase PWM output for BLDC motor control (positive W phase).
	GTOWLO	Output	Three-phase PWM output for BLDC motor control (negative W phase).
AGT	AGTEE0, AGTEE1	Input	External event input enable.
	AGTIO0, AGTIO1	I/O	External event input and pulse output.
	AGTO0, AGTO1	Output	Pulse output.
	AGTOA0, AGTOA1	Output	Output compare match A output.
	AGTOB0, AGTOB1	Output	Output compare match B output.
RTC	RTCOUT	Output	Output pin for 1-Hz/64-Hz clock.

**Table 1.14 Pin functions (2/3)**

<b>Function</b>	<b>Signal</b>	<b>I/O</b>	<b>Description</b>
SCI	SCK0, SCK1, SCK9	I/O	Input/output pins for the clock (clock synchronous mode).
	RXD0, RXD1, RXD9	Input	Input pins for received data (asynchronous mode/clock synchronous mode).
	TXD0, TXD1, TXD9	Output	Output pins for transmitted data (asynchronous mode/clock synchronous mode).
	CTS0_RTS0, CTS1_RTS1, CTS9_RTS9	I/O	Input/Output pins for controlling the start of transmission and reception (asynchronous mode/clock synchronous mode), active LOW.
	SCL0, SCL1, SCL9	I/O	Input/output pins for the IIC clock (simple IIC).
	SDA0, SDA1, SDA9	I/O	Input/output pins for the IIC data (simple IIC).
	SCK0, SCK1, SCK9	I/O	Input/output pins for the clock (simple SPI).
	MISO0, MISO1, MISO9	I/O	Input/output pins for slave transmission of data (simple SPI).
	MOSI0, MOSI1, MOSI9	I/O	Input/output pins for master transmission of data (simple SPI).
IIC	SS0, SS1, SS9	Input	Slave-select input pins (simple SPI), active LOW.
	SCL0, SCL1	I/O	Input/output pins for clock.
SPI	SDA0, SDA1	I/O	Input/output pins for data.
	RSPCKA, RSPCKB	I/O	Clock input/output pin.
	MOSIA, MOSIB	I/O	Inputs or outputs data output from the master.
	MISOA, MISOB	I/O	Inputs or outputs data output from the slave.
	SSLA0, SSLB0	I/O	Input or output pin for slave selection.
	SSLA1 to SSLA3, SSLB1 to SSLB3	Output	Output pin for slave selection.
CAN	CRX0	Input	Receive data.
	CTX0	Output	Transmit data.
USBFS	VSS_USB	Input	Ground pins.
	VCC_USB_LDO	Input	Power supply pin for USB LDO regulator.
	VCC_USB	I/O	Input: Power supply pin for USB transceiver. Output: USB LDO regulator output pin. This pin should be connected to an external capacitor.
	USB_DP	I/O	D+ I/O pin of the USB on-chip transceiver. This pin should be connected to the D+ pin of the USB bus.
	USB_DM	I/O	D– I/O pin of the USB on-chip transceiver. This pin should be connected to the D– pin of the USB bus.
	USB_VBUS	Input	USB cable connection monitor pin. This pin should be connected to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a function controller.
Analog power supply	AVCC0	Input	Analog voltage supply pin for the analog. Connect this pin to VCC.
	AVSS0	Input	Analog ground pin. Connect this pin to VSS.
	VREFH0	Input	Analog reference voltage supply pin for the A/D converter. Connect this pin to VCC when not using the A/D converter.
	VREFL0	Input	Analog reference ground pin for the A/D converter. Connect this pin to VSS when not using the A/D converter.

<b>Function</b>	<b>Signal</b>	<b>I/O</b>	<b>Description</b>
ADC14	AN000 to AN010, AN016 to AN022	Input	Input pins for the analog signals to be processed by the A/D converter.
	ADTRG0	Input	Input pins for the external trigger signals that start the A/D conversion, active LOW.
DAC12	DA0	Output	Output pins for the analog signals to be processed by the D/A converter.
ACMPLP	VCOUP	Output	Comparator output pin.
	CMPREF0, CMPREF1	Input	Reference voltage input pins.
	CMPIN0, CMPIN1	Input	Analog voltage input pins.
CTSU	TS00 to TS28, TS30, TS31	Input	Capacitive touch detection pins (touch pins).
	TSCAP	-	Secondary power supply pin for the touch driver.
KINT	KR00 to KR07	Input	Key interrupt input pins.
I/O ports	P000 to P004, P010 to P015	I/O	General-purpose input/output pins.
	P100 to P113	I/O	General-purpose input/output pins.
	P200	Input	General-purpose input pin.
	P201, P204 to P206, P212, P213	I/O	General-purpose input/output pins.
	P214, P215	Input	General-purpose input pins.
	P300 to P304	I/O	General-purpose input/output pins.
	P400 to P403, P407 to P411	I/O	General-purpose input/output pins.
	P500 to P502	I/O	General-purpose input/output pins.

## 2. Electrical Characteristics

Unless otherwise specified, the electrical characteristics of the MCU are defined under the following conditions:

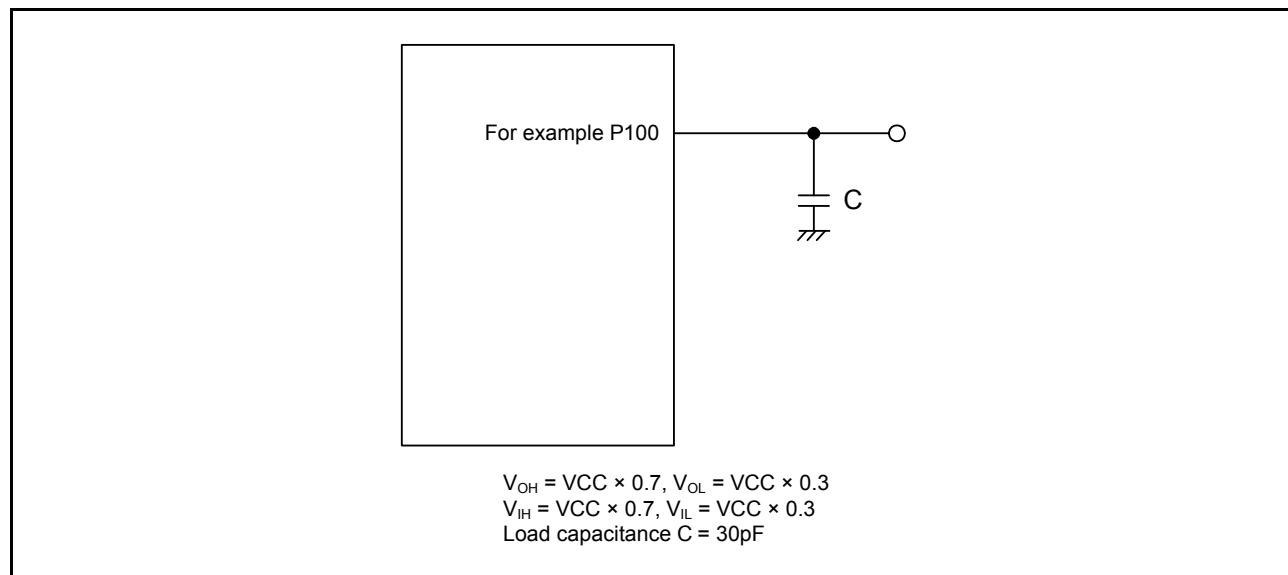

$VCC^*1 = AVCC0 = VCC\_USB^*2 = VCC\_USB\_LDO^*2 = 1.6$  to  $5.5V$ ,  $VREFH0 = 1.6$  to  $AVCC0$ ,

$VSS = AVSS0 = VREFL0 = VSS\_USB = 0$  V,  $Ta = T_{opr}$

Note 1. The typical condition is set to  $VCC = 3.3V$ .

Note 2. When USBFS is not used.

Figure 2.1 shows the timing conditions.

**Figure 2.1 Input or output timing measurement conditions**

The measurement conditions of timing specification in each peripherals are recommended for the best peripheral operation. However, make sure to adjust driving abilities of each pins to meet your conditions.

## 2.1 Absolute Maximum Ratings

**Table 2.1 Absolute maximum ratings**

Item	Symbol	Value	Unit
Power supply voltage	VCC	-0.5 to +6.5	V
Input voltage	5V-tolerant ports*1	V <sub>in</sub>	-0.3 to +6.5
	P000 to P004 P010 to P015	V <sub>in</sub>	-0.3 to AVCC0 + 0.3
	Others	V <sub>in</sub>	-0.3 to VCC + 0.3
Reference power supply voltage	VREFH0	-0.3 to +6.5	V
Analog power supply voltage	AVCC0	-0.5 to +6.5	V
USB power supply voltage	VCC_USB	-0.5 to +6.5	V
	VCC_USB_LDO	-0.5 to +6.5	V
Analog input voltage	V <sub>AN</sub>	-0.3 to AVCC0 + 0.3	V
		-0.3 to VCC + 0.3	V
Operating temperature*2 *3	T <sub>opr</sub>	-40 to +105	°C
Storage temperature	T <sub>stg</sub>	-55 to +125	°C

**Caution:** Permanent damage to the MCU may result if absolute maximum ratings are exceeded.

To preclude any malfunctions due to noise interference, insert capacitors of high frequency characteristics between the VCC and VSS pins, between the AVCC0 and AVSS0 pins, between the VCC\_USB and VSS\_USB pins, and between the VREFH0 and VREFL0 pins. Place capacitors of about 0.1  $\mu$ F as close as possible to every power supply pin and use the shortest and heaviest possible traces. Also, connect capacitors as stabilization capacitance.

Connect the VCL pin to a VSS pin by a 4.7- $\mu$ F capacitor. The capacitor must be placed close to the pin.

Note 1. Ports P205, P206, P400, P401, and P407 are 5V-tolerant.

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up might cause malfunction and the abnormal current that passes in the device at this time might cause degradation of internal elements.

Note 2. See section 2.2.1, T<sub>j</sub>/T<sub>a</sub> Definition.

Note 3. Contact Renesas Electronics sales office for information on derating operation under T<sub>a</sub> = +85°C to +105°C. Derating is the systematic reduction of load for improved reliability.

**Table 2.2 Recommended operating conditions**

Item	Symbol	Value	Min	Typ	Max	Unit
Power supply voltages	VCC <sup>*1, *2</sup>	When USBFS is not used	1.6	-	5.5	V

USB power supply voltages	VCC_USB	When USBFS is not used	-	VCC	-	V
		When USBFS is used USB Regulator Disable (Input)	3.0	3.3	3.6	V
	VCC_USB_LDO	When USBFS is not used	-	VCC	-	V
		When USBFS is used USB Regulator Enable	3.8	-	5.5	V
	VSS_USB		-	0	-	V
Analog power supply voltages	AVCC0 <sup>*1, *2</sup>		1.6	-	5.5	V
	AVSS0		-	0	-	V
	VREFH0	When used as ADC14 Reference	1.6	-	AVCC0	V
	VREFL0		-	0	-	V

Note 1. Use AVCC0 and VCC under the following conditions:

AVCC0 and VCC can be set individually within the operating range when  $VCC \geq 2.0\text{ V}$

$AVCC0 = VCC$  when  $VCC < 2.0\text{ V}$ .

Note 2. When powering on the VCC and AVCC0 pins, power them on at the same time or the VCC pin first and then the AVCC0 pin.

### Absolute accuracy

Absolute accuracy is the difference between output code based on the theoretical A/D conversion characteristics, and the actual A/D conversion result. When measuring absolute accuracy, the voltage at the midpoint of the width of the analog input voltage (1-LSB width), which can meet the expectation of outputting an equal code based on the theoretical A/D conversion characteristics, is used as the analog input voltage. For example, if 12-bit resolution is used and the reference voltage  $V_{REFH0} = 3.072$  V, then 1-LSB width becomes 0.75 mV, and 0 mV, 0.75 mV, and 1.5 mV are used as the analog input voltages. If analog input voltage is 6 mV, an absolute accuracy of  $\pm 5$  LSB means that the actual A/D conversion result is in the range of 003h to 00Dh, though an output code of 008h can be expected from the theoretical A/D conversion characteristics.

### Integral nonlinearity error (INL)

Integral nonlinearity error is the maximum deviation between the ideal line when the measured offset and full-scale errors are zeroed, and the actual output code.

### Differential nonlinearity error (DNL)

Differential nonlinearity error is the difference between 1-LSB width based on the ideal A/D conversion characteristics and the width of the actual output code.

### Offset error

Offset error is the difference between the transition point of the ideal first output code and the actual first output code.

### Full-scale error

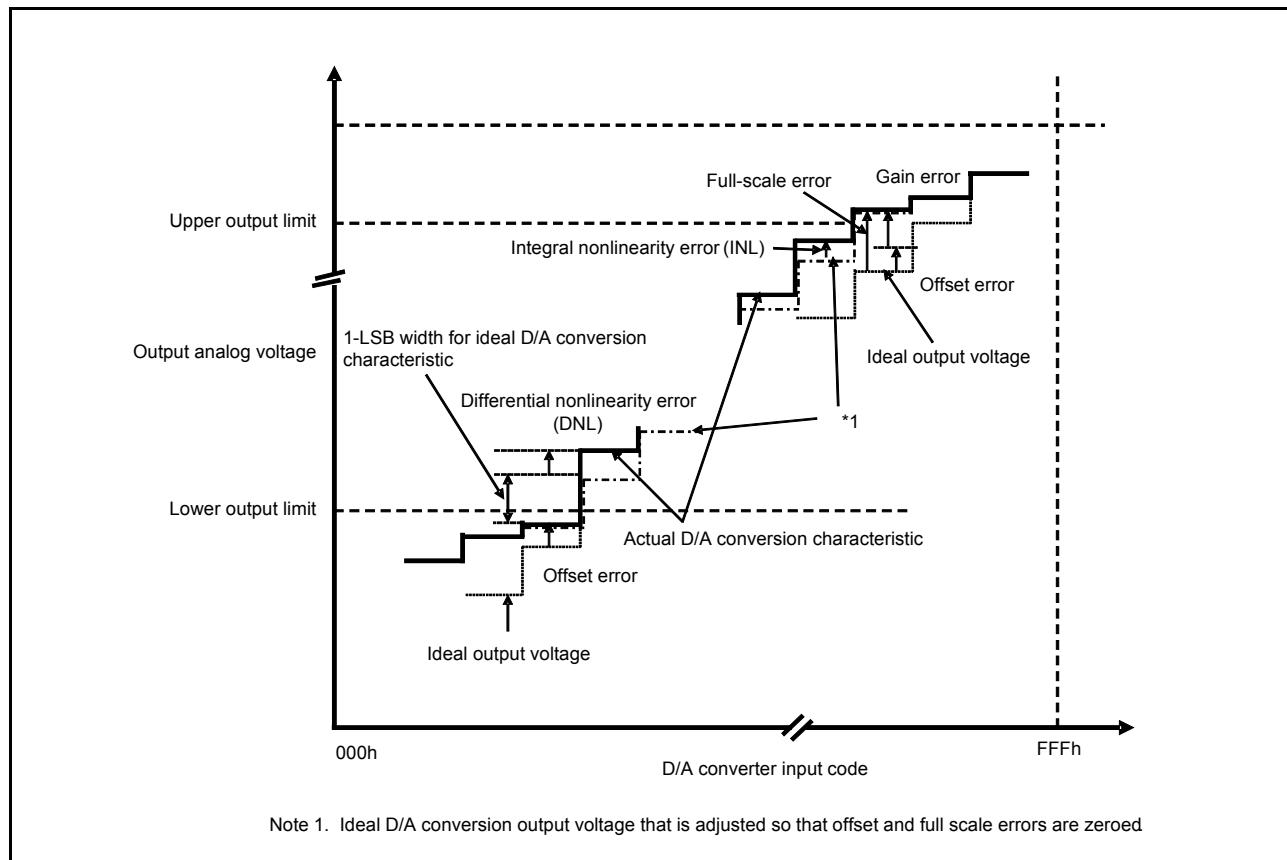

Full-scale error is the difference between the transition point of the ideal last output code and the actual last output code.

### Integral nonlinearity error (INL)

Integral nonlinearity error is the maximum deviation between the ideal output voltage based on the ideal conversion characteristic when the measured offset and full-scale errors are zeroed, and the actual output voltage.

### Differential nonlinearity error (DNL)

Differential nonlinearity error is the difference between 1-LSB voltage width based on the ideal D/A conversion characteristics and the width of the actual output voltage.

### Offset error

Offset error is the difference between the highest actual output voltage that falls below the lower output limit and the ideal output voltage based on the input code.

### Full-scale error

Full-scale error is the difference between the lowest actual output voltage that exceeds the upper output limit and the ideal output voltage based on the input code.

- Note 1. The reprogram/erase cycle is the number of erasures for each block. When the reprogram/erase cycle is n times (n = 1,000), erasing can be performed n times for each block. For instance, when 4-byte programming is performed 256 times for different addresses in 1-KB blocks, and then the entire block is erased, the reprogram/erase cycle is counted as one. However, programming the same address for several times as one erasure is not enabled. (overwriting is prohibited.)

Data flash STOP recovery time	t <sub>DSTOP</sub>	720	-	-	720	-	-	ns	

Note 1. Does not include the time until each operation of the flash memory is started after instructions are executed by the software.

Note 2. The lower-limit frequency of ICLK is 1 MHz during programming or erasing the flash memory. When using ICLK at below 4 MHz, the frequency can be set to 1 MHz, 2 MHz, or 3 MHz. A non-integer frequency such as 1.5 MHz cannot be set.

Note 3. The frequency accuracy of ICLK must be ±3.5% while programming or erasing the flash memory. Confirm the frequency accuracy of the clock source.

## General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

### 1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

### 2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

### 3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

### 4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

### 5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

### 6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between VIL (Max.) and VIH (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between VIL (Max.) and VIH (Min.).

### 7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

### 8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
3. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from such alteration, modification, copy or otherwise misappropriation of Renesas Electronics product.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.  
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots etc.  
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; and safety equipment etc.  
Renesas Electronics products are neither intended nor authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems, surgical implants etc.), or may cause serious property damages (nuclear reactor control systems, military equipment etc.). You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application for which it is not intended. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for which the product is not intended by Renesas Electronics.
6. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You should not use Renesas Electronics products or technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. When exporting the Renesas Electronics products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, who distributes, disposes of, or otherwise places the product with a third party, to notify such third party in advance of the contents and conditions set forth in this document, Renesas Electronics assumes no responsibility for any losses incurred by you or third parties as a result of unauthorized use of Renesas Electronics products.
11. This document may not be reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
